

Hackathon Use Case Brief

1. Goals and Motivation

Challenge Name: Building a Realpage AI Marketplace

Core System / Intelligence Layer Name: Realpage AI Marketplace - a governed collection of shareable skills, plugins, templates, dashboards, and workflow patterns

Sponsor (Company / Business Unit): AI Enablement

Domain: Internal AI enablement, reusable assets, productivity, design, governance, and adoption

Business Unit / Product Name: AI For All / all Realpagers

Problem Statement

Describe the core problem:

Realpagers create useful AI workflows, skills, plugins, templates, dashboards, and other assets, but those assets can remain isolated with the person or team that made them. Without a shared marketplace model, people repeatedly rebuild similar work, cannot easily discover what already exists, and lack a consistent way to test, review, package, and reuse contributions across Realpage.

Key Pain Points:

- Useful AI work is scattered across individuals, teams, and tools.
- People spend time rebuilding assets that others have already created.
- Contributors need a flexible way to build for a narrow domain such as Sales, HR, or Smart Building or for a broad Realpage audience.
- Shared assets need visible ownership, security review, testing, documentation, versioning, and a clear publishing path.

Reference Workflow Diagram

Choose a business problem or repeatable job -> build one or more skills, plugins, templates, dashboards, or workflow patterns -> document audience, inputs, outputs, limits, and owner -> test original and second scenario -> human review -> save in the designated Teams chat and OneDrive/SharePoint folder -> share, maintain, and improve

Scope boundary: Teams may choose any topic, audience, and one or more asset types. Contributions may be narrow or broad, including Sales, HR, Smart Building, or another Realpage need. Every contribution still needs a clear purpose, safe inputs, testing, documentation, ownership, and review before broad sharing.

2. Hero Features - What You Could Build

Teams are encouraged to build the smallest useful contribution or set of related contributions that could belong in a Realpage AI Marketplace.

Feature	Description
Flexible contribution	Allow teams to choose any topic, audience, and one or more asset types, from a narrow Sales tool to a broad Realpage resource.
Marketplace-ready asset package	Build a skill, plugin, template, dashboard, workflow pattern, or combination with clear purpose, inputs, outputs, and limits.
Tested reuse	Demonstrate the asset on the original scenario and at least one new scenario, user group, or domain without rebuilding the core pattern.
Security and human review	Check permissions, data handling, failure behavior, unsupported claims, and reviewer acceptance before broad sharing.
Publishing and maintenance path	Save the contribution in the designated Teams chat and OneDrive/SharePoint folder with owner, version, setup guidance, and update expectations.

3. Hints and Resources

Data Sources

Data	Description
Existing AI work or repeatable process	Start from any useful work, workflow, prompt, skill, plugin, template, dashboard, or process the team is allowed to use.
Approved internal guidance and examples	Use relevant Realpage guidance, brand, accessibility, security, governance, or business examples when applicable.
Team-defined representative scenarios	Choose realistic scenarios that match the intended audience and at least one reuse test; sanitize or synthesize examples as required.
Approved tools and connectors	Use the AI tools, Teams, OneDrive/SharePoint locations, and connectors available and approved for the team's work.

Usage and reviewer feedback	Capture hours saved, usefulness, security findings, TAM estimate, design feedback for templates, and requested refinements.
-----------------------------	---

AI & Cloud Tools (Optional but Encouraged)

Tool	Purpose
Approved AI tools	Use the team's approved AI tool or tools to build, test, document, and refine the contribution.
Teams chat	Share working files, collaboration, test feedback, and the final contribution in the designated hackathon Teams chat.
OneDrive/SharePoint folder	Store the durable asset package, source materials, examples, links, and handoff documentation for easy access.
Approved connectors and packaging surfaces	Use connectors and packaging surfaces only where approved and available; start with least privilege and read-only access where appropriate.
Documentation and validation checklist	Record setup, inputs, outputs, limitations, security checks, version, owner, reuse test, and review status.

4. Evaluation Criteria

Criterion	What Success Looks Like
Hours of work saved	Show estimated or measured time reduction compared with the prior process, with the comparison basis stated.
Usefulness of asset	Demonstrate that the intended audience can use the contribution to solve a real job or workflow.
Security of asset	Use approved tools and data, apply least privilege, avoid secrets and sensitive content, document limits, and preserve human review.
Total addressable market within Realpage	Explain how many users, teams, business units, or similar workflows could benefit and why the reach is credible.
Style/design if a template	For template submissions, assess clarity, usability, accessibility, visual quality, and fit for the intended audience. For other asset types, mark not applicable.

5. Why It Matters

Business Impact Summary: A Realpage AI Marketplace could reduce duplicate build effort, save hours across the organization, accelerate adoption, and make successful AI work easier to find and reuse. It also creates a visible learning and governance loop: contributors build, test, document, and share assets that can serve a single team or a broad Realpage audience.
